Parent Survey

Parents were asked to rate on a five-point scale their opinion. They were advised that not all questions had to be answered. Of 100 surveys sent out, 49 replies were received. A numerical value in percentage form was created by giving a value of 5 points to each Very Good score and 1 point to each Very Poor score and so on. This produced a numerical score that when compared to the highest possible score for each answered question produced the percentage of the given score.

Eg  For question one about the general operation of the school:
The 49 replies to this question give a possible highest score of 245. The numerical score is 201 from \((1\times2) + (5\times3) + (26\times4) + (16\times5)\)
\[
\frac{201}{245}\times100 = 82\% \text{ positive rating}
\]
